Under the Guidance.

We are thankful to my project guide for guiding me to complete the Project. His suggestions and valuable information regarding the formation of the Project Report have provided me a lot of help in completing the Project and its related topics.

We are also thankful to my family member and friends who were always there to provide support and moral boost up.

Abstract

The project called **Skill Swap Platform** is a web-based platform that helps people exchange skills without paying money. Users create profiles listing the skills they can teach and the skills they want to learn. The system compares these lists and displays people with matching or complementary skills. Users can view profiles, send and manage swap requests, discuss the exchange through chat, and schedule a session. After completing a swap, users can rate and review each other.

The application uses React for the user interface, Node.js and Express for the backend, and MongoDB for storing user profiles, swap requests, messages, and ratings. JWT-based authentication helps protect account features, while Socket.IO supports real-time chat. Skill Swap aims to make peer-to-peer learning easier by connecting people who can learn from one another.

1. Introduction

Today, many people want to learn new skills, while others already have skills they can teach. Finding the right person to learn from can be difficult. Paid classes may also be too expensive for some people. **Skill Swap** helps people connect and learn from one another without paying money for lessons.

Users create a profile and add two lists: the skills they can teach and the skills they want to learn. For example, one person may teach Python and want to learn guitar. Another person may teach guitar and want to learn Python. Skill Swap can show these people as a match because each person can teach what the other wants to learn.

After finding a match, users can view each other's profiles and send a skill swap request. They can accept or reject requests, chat about the lessons, and plan a time to learn. When the swap is complete, they can rate and review each other. These features help users manage the learning process in one place.

Skill Swap is built using React for the website, Node.js and Express for the server, and MongoDB for storing user and swap information. The project aims to make learning more social, affordable, and accessible by helping people share their knowledge with one another.

1.1 Objective of the Present Work

The main objective of Skill Swap is to help people teach and learn skills from one another without paying for lessons. The project provides a simple platform where users can list the skills they can teach and the skills they want to learn.

The system aims to:

- Connect users with people who have matching or complementary skills.
- Let users create profiles and view other learners' profiles.
- Allow users to send, accept, or reject skill swap requests.
- Provide chat and scheduling features to help users plan their learning sessions.
- Let users rate and review each other after completing a skill swap.
- Store user profiles, requests, messages, and ratings securely in a database.

System analysis

3.1 PROBLEM DEFINITION

Many people want to learn new skills. Many others can teach skills but cannot easily find learners. It can be hard to find someone who wants to learn what you can teach and can teach what you want to learn.

Skill Swap helps solve this problem. Users add the skills they can teach and the skills they want to learn. The app helps them find other users, send swap requests, chat, and plan learning sessions.

3.2 Preliminary Investigation

Purpose

Skill Swap helps people teach and learn skills from each other for free. Users can share what they know and find someone who can teach them something new.

Benefits

The portal provides several advantages:

- Users can learn new skills for free.
- Users can share skills they already know.
- It helps people find others with similar learning interests.
- Users can chat and plan their learning sessions in one place.
- It helps people meet and learn from one another.

3.3 Feasibility Study

A feasibility study checks whether the SkillSwap project can be built and used successfully.

Technical Feasibility

SkillSwap uses React, Node.js, Express, and MongoDB. These tools are available and support the project's main features, such as user profiles, skill matching, swap requests, and chat. The project can run on a standard computer with an internet connection.

Economic Feasibility

The project uses free and open-source tools. MongoDB Atlas offers a free option for development. A computer and internet connection are needed. Hosting the project for many users may involve extra costs.

Operational Feasibility

The website is designed to be simple to use. Users can create profiles, list skills, find possible matches, send requests, chat, and plan learning sessions.

Schedule Feasibility

The project can be completed in stages: designing the website, building the frontend and backend, connecting the database, and checking the main features.

3.4 Project Planning

The SkillSwap project was planned in stages so each part could be built and connected step by step.

1. Requirement collection - Decide what users should be able to do, such as create profiles and exchange skills.
2. Design Plan the website pages, database information, and how users move through the app.
3. Frontend development Build pages for signup, login, profiles, matches, requests, and chat.

Purpose of Project Planning

Project planning helps organize the work before development begins. It sets clear tasks, goals, and steps for building SkillSwap. It also helps manage time, use resources properly, track progress, and complete the project in an organized way.

Phases Covered in the Plan

The planning is divided into different phases to ensure smooth execution:

1. **Requirement collection:** Decide what the users need from SkillSwap.
2. **Design:** Plan the website pages, features, and database.
3. **Frontend development:** Build the pages users see and interact with.
4. **Backend development:** Build the server features and app logic.
5. **Database setup:** Connect MongoDB to store project information.

System Overview

SkillSwap is a web application where users share skills and find people to learn from. Each user creates a profile and lists the skills they can teach and the skills they want to learn. The system compares these lists and displays suitable matches:

The application has three main parts. The **React frontend** displays pages such as login, profiles, matches, and swap requests. The **Node.js and Express backend** handles user accounts and app features. **MongoDB** stores profiles, swap requests, chat messages, and ratings.

Software & Hardware Requirements

Software Requirements

- **Operating system:** Windows 10 or later
- **Frontend:** React and Vite
- **Backend:** Node.js and Express.js
- **Package manager:** npm
- **Database:** MongoDB Atlas or MongoDB Server
- **Code editor:** Visual Studio Code
- **Browser:** Google Chrome, Microsoft Edge, or another modern browser
- **Internet connection:** Needed to connect to MongoDB Atlas

Hardware Requirements

- **Processor:** Intel Core i3 or similar
- **RAM:** Minimum 4 GB; 8 GB recommended
- **Storage:** At least 2 GB free space
- **Network:** Internet connection for development and online use

Functional Requirements:

The SkillSwap system should allow users to:

- **Create an account, log in, and log out.**
- **Add and update their profile information.**
- **List skills they can teach and skills they want to learn.**
- **Search for users and view their profiles.**
- **See suggested matches based on their skills.**
- **Send swap requests and accept, reject, or cancel requests.**
- **Chat with another user about a swap.**
- **Schedule a learning session.**
- **Mark a swap as complete.**
- **Rate and review the other user after the swap.**

System Design

SkillSwap uses a three-part design: frontend, backend, and database.

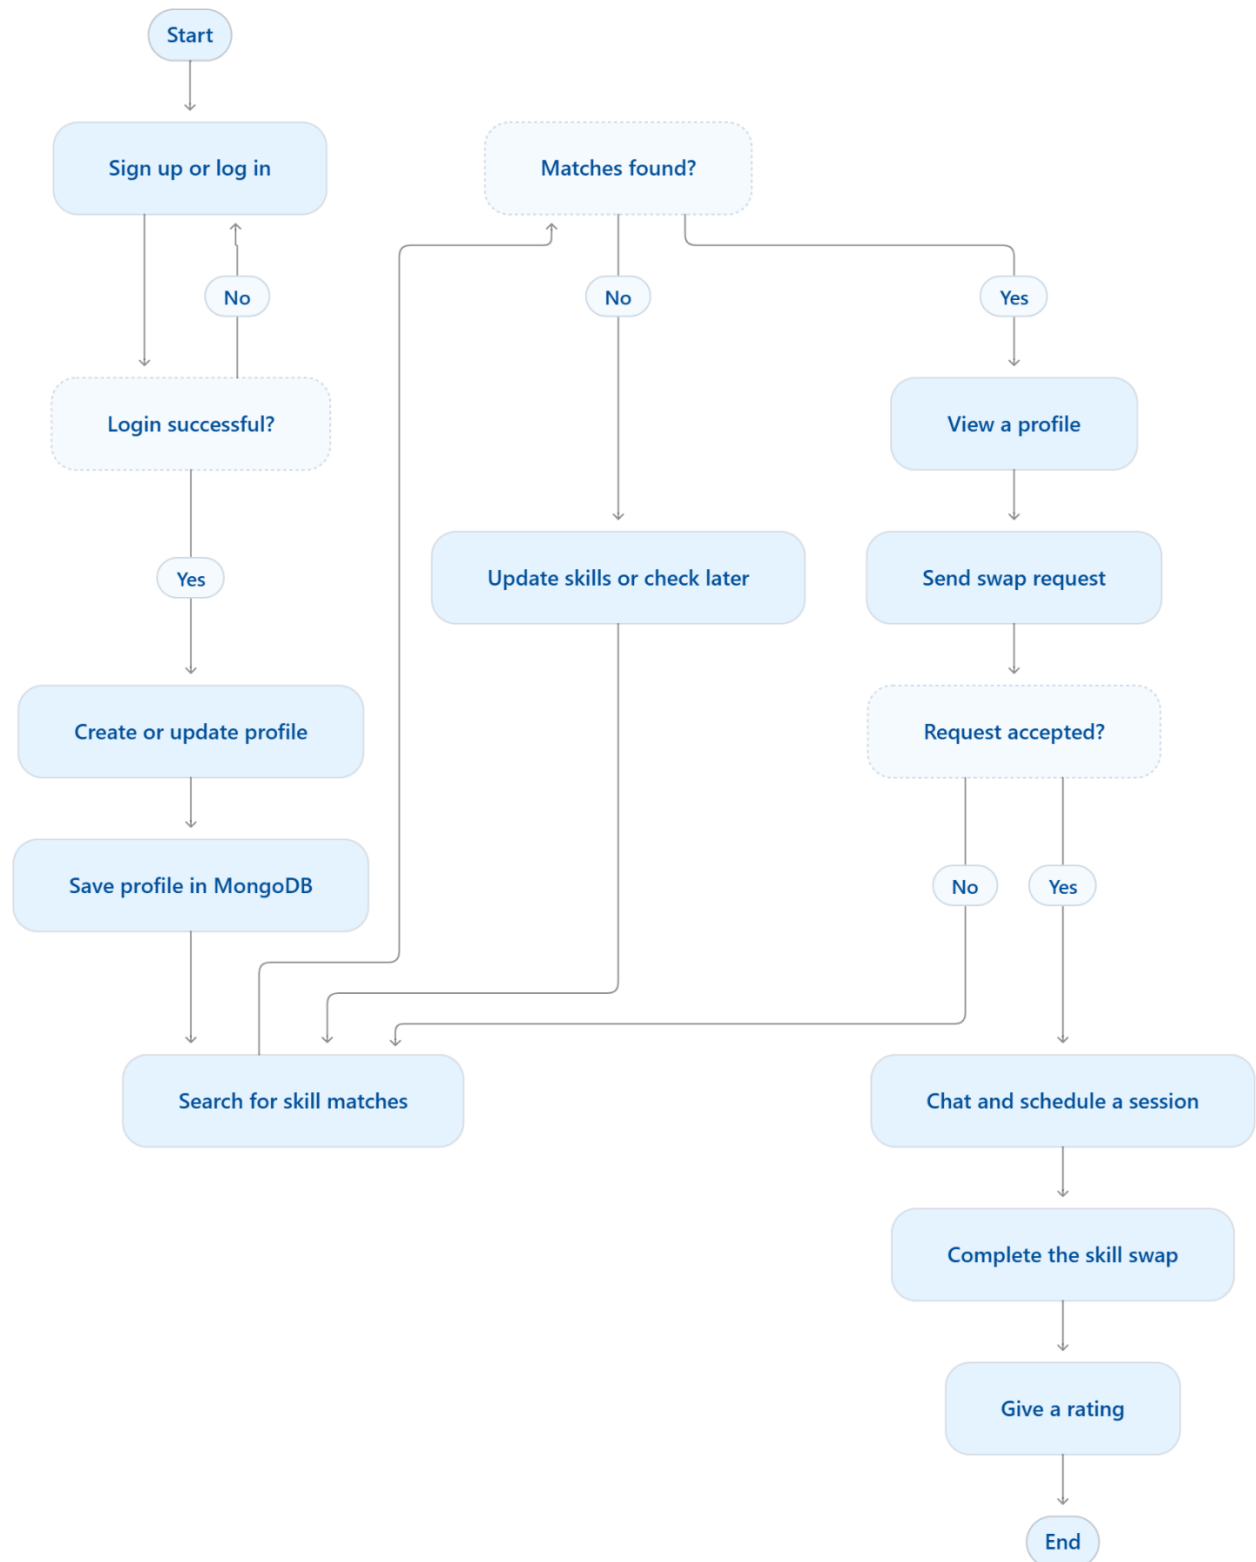

- **Frontend:** The React website shows pages for signup, profiles, matches, swap requests, and chat.
- **Backend:** The Node.js and Express server receives requests from the website. It handles login, skill matching, swap requests, messages, and ratings.

- **Database:**

MongoDB stores user profiles, skills, swap requests, chat messages, and ratings.

The frontend sends a request to the backend. The backend processes it, reads or saves information in MongoDB, and sends a response back to the website. Login protection keeps private features available only to signed-in users. Socket.IO supports live chat.

Flowchart:

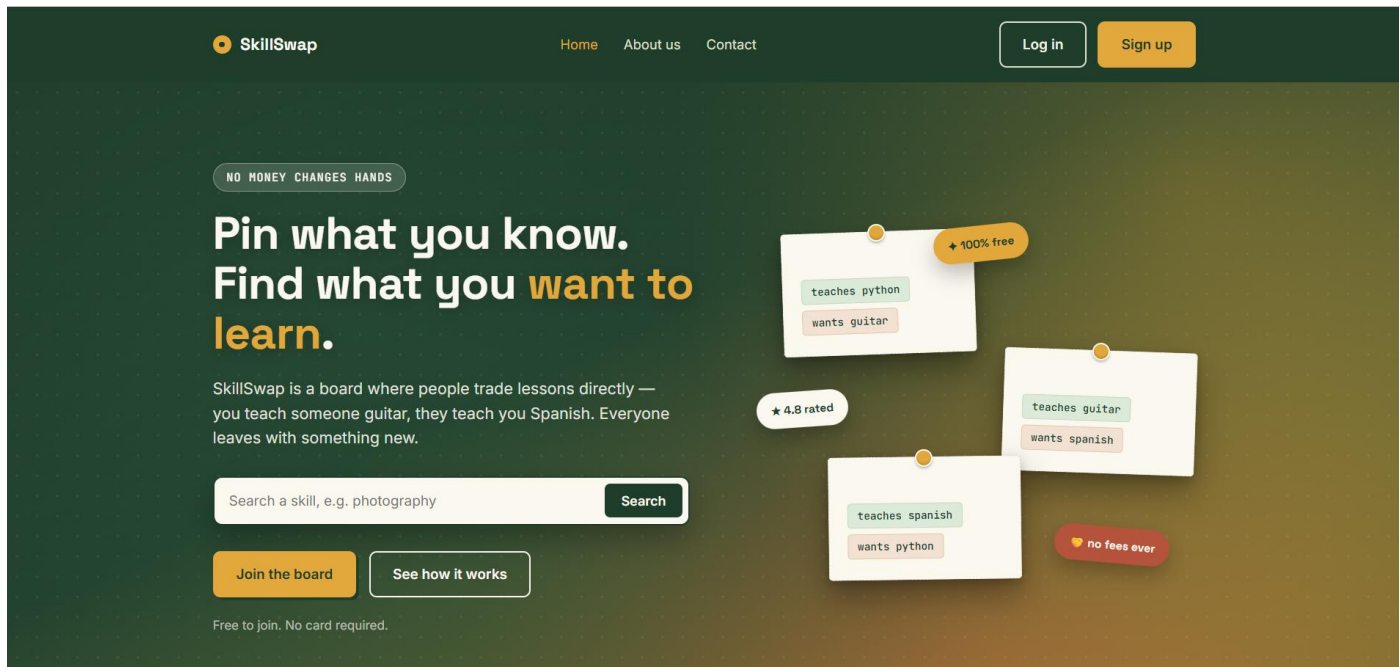

Steps in the Flowchart:

1. The user signs up or logs in.
2. If login fails, the user tries again.
3. After login, the user creates or updates their profile.
4. The profile is saved in MongoDB.
5. The system searches for people with matching skills.
6. If no match is found, the user can update their skills or check again later.
7. If matches are found, the user views a profile and sends a swap request.
8. If the request is rejected, the user can look for another match.
9. If the request is accepted, both users chat and schedule a session.
10. They complete the skill swap and give each other a rating.

Future scope

The Skill Swap Platform can be enhanced with the following features:

- Video calls for online lessons.
- Notifications for new matches and swap requests.
- A calendar to plan learning sessions.
- More languages and skill categories.
- A mobile app for phones.
- Better matching based on users' interests and skill levels.
- Certificates or badges for completed swaps.

Conclusion

Skill Swap helps people teach and learn skills from each other for free. Users can create profiles, find people with matching skills, send swap requests, chat, and plan learning sessions.

The project makes it easier to share knowledge and learn new things. In the future, features like video lessons and mobile access could make it even more useful.
